# Tight fit for tanks

Waterrecycling company Aquacell has launched its modular water tanks as a standalone product for commercial applications.

Each rectangular tank holds 5,000 litres and can be used in a modular system making them ideal for tight spaces.

Aquacell's CEO Colin Fisher said his company originally developed the tanks to be part of its greywater and blackwater recycling plants.

However, he has received so many requests for them as a

standalone product that Aquacell is now offering them on its own.

"Our focus is on the commercial/multi-dwelling market where the tanks could potentially be used to capture and store rainwater, stormwater, firewater, cooling tower make-up, potable water, treated wastewater and more," he said.

"Our rectangular-shaped tanks are more space efficient than round tanks and cheaper than stainless steel panel tanks.

"We expect them to be popular

**Modular:** Aquacell's new range of modular water tanks are ideal for tight spaces.

with plumbers, builders and hydraulic consultants as well as others who specify water tanks," Mr Fisher said.

The modular tanks are rectangular and each holds 5,000 litres.

The tanks measure 1.2 m wide x 2.5 m long x 2.2 m high. They are made of recyclable polyethylene which is an environmentally-sound material.
